1. Health Bar

i) What states can it be in? The health bar can be full, low, or empty or have a medium health state, i.e., the colour can change accordingly: green, yellow, wine, or red. Also, they can see the number, i.e., 20%/100.

ii) How does content get in and out?
For my farming game, the higher the vegetables eaten, the higher the health, and as the bird gets hungry over time, the health drops, and also at the beginning of the game, the health is low.

iii) How does it work with no mouse?
As it does not work with a mouse, the player can always only see the information on the screen; they cannot click it either.

iv) What confirms an action happened or failed?
For my farming game, when health is in a good state, the bar flashes green and when it is in a bad state, the bar is red and when health goes down, the bird shakes.

v) What happens at zero, at maximum, and at the longest string?
When health is empty, the game ends, the player sees game over, and they can restart by clicking the restart button; at maximum game, it keeps playing, and the longest string is 100.

vi) Does it survive a save and load?
Yes, if you save, go away, come back and load, it would still be the same value as it was before exiting.

vii) How does a new player learn it exists?

viii) It can be seen on the screen; it changes face when hungry and shakes.

2: pause menu

i) What states can it be in?
A button shows on the screen and is being pressed.

ii) How does content get in and out?
The pause menu uses the P to make it appear and go away.

iii) How does it work with no mouse?

iv) The player can press on the P key, the arrow key to move between the buttons and press enter.

v) What confirms an action happened or failed?
When players press Resume or P and enter, the game continues, and they know it works, or the game stops, and they know it's paused.

i) What happens at zero, at maximum, and at the longest string?

ii) At zero, when the player has just started the game, the pause menu is active and clickable or when they have lost their health level and the game ends, the pause menu is inactive.

iii) At maximum, i can introduce the scroll option.

iv) At the longest string, if the pause menu is at the longest string, then it can transfer into the next line.

vi) Does it survive a save and load? No, because the pause menu does not hold any record of a player's previous action.

vii) How does a new player learn it exists? A new player knows it exists, as there is a pause button on screen

3: Notification Toast

i) What states can it be in?
It appears on the screen, but first it is hidden, then it appears, and it shows for some seconds and disappears.

ii) How does content get in and out?
when the bird eats a vegetable, a small box appears at the top saying how many maize are left, and after 2 seconds it fades away by itself, without any additional input.

iii) How does it work with no mouse? The player does not need to press it because it pops up proactively as a result of the player action in the game when they reach a certain number.

iv) What confirms an action happened or failed?
Seeing the popup on screen is a confirmation that the action happened.

v) What happens at zero, at maximum, and at the longest string?

i) At Zero, it says nothing because the game ends.

ii) At maximum, for example, when the bird eats 3 vegetables very fast, the pop-ups replace each other.

iii) the longest string, the message goes into the next line within the popup box.

vi) Does it survive a save and load? No, because it does not hold any record from the game.

vii) How does a new player learn it exists? The player learns it exists because it shows up itself; they will first see it when the player starts eating the corn.
